

## Overview

The LA7975 is an IC that converts PAL SIF signals ( 5.5 MHz , 6 MHz , and 6.5 MHz ) to 6 MHz . For the sake of high sound quality, this IC uses a unique mixer technique to supress interference from NICAM signals.

## Functions

- Mixer, amplifier, oscillator, oscillator mute

## Features

- Resistant to interference by NICAM signals
- Small SIP-5 package
- Wide range of usage voltage ( 5 V to 12 V )

## Package Dimensions

unit : mm
3042C-SIP5

SANYO : SIP5

(Pin 4 oscillation waveform)

- Pin 1 is the SIF input pin.

The filter in Figure 2 can be connected to the input section to improve the buzz characteristic.
Figure 3 shows the characteristics for the filter in Figure 2. If C 1 is too small, the buzz characteristic improves for normal input, but the filter cuts into the sound carrier and the buzz characteristic deteriorates for the P/S (picture/sound carrier) ratio.
Use $\mathrm{C} 1 \fallingdotseq 20 \mathrm{pF}$ to 47 pF .

- Pin 4 is the ceramic oscillator pin.

To make the oscillation waveform approach a sine wave,the oscillation level is controlled internally.
Oscillation levels of 15 to 80 mVp -p at Pin 4 give the waveform shown in Figure 5.
To stop oscillation, attach an external resistor as in Figure 6 and switch S1 on.

Here are the conditions for handling multiple systems.

| Input frequency | Oscillator | Pin 5 output |
| :---: | :---: | :---: |
| 5.5 MHz | 500 kHz | 6 MHz |
| 6.0 MHz | Oscillation stop | 6 MHz <br> (pass through) |
| 6.5 MHz | 500 kHz | 6 MHz |
| 4.5 MHz | 1.5 MHz | 6 MHz |

## LA7975

- Pin 5 is the output pin. The output from Pin 5 is input to the SIF via a 6 MHz bandpass filter (BPF).
When 5.5 MHz is input to Pin 1, the spectrum shown in Figure 10 is obtained at Pin 5 . Even if there is a 5.85 MHz NICAM signal, the $\mathrm{D} / \mathrm{U}$ (desirable/undesirable) ratio at Pin 5 increases and the buzz characteristic does not deteriorate.

When 6 MHz is input at Pin 1 and there is a 6.552 MHz NICAM signal, then 6.552 MHz is mixed with 500 kHz to make 6.052 MHz . This becomes an interference signal and is within the band for 6 MHz . Therefore, for 6 MHz input, Pin 4 is grounded with $10 \mathrm{k} \Omega$ to stop the oscillation and pass through the input signal 6 MHz as is.
